Imperial College London

Trigger Efficiency Measurements in Re-Reco Data

P. Dunne

Overview

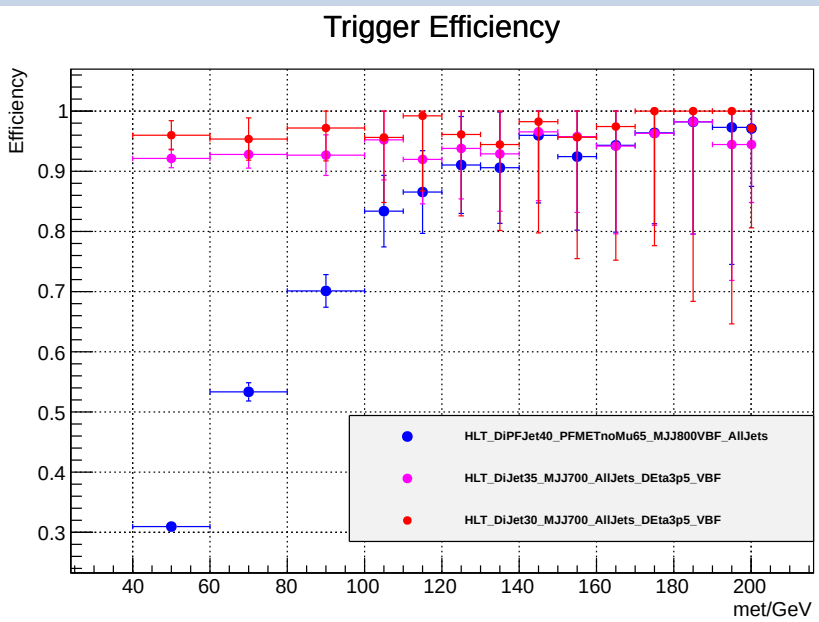
- Last time I presented 1D efficiencies for met, mjj and jet 2 pt
- The following additions were asked for and will be shown today:
  - Check the difference between the cuts used and those used by Phat for the paper
  - Get the $\Delta\eta_{jj}$ turn on
  - Check the effect of applying the L1 Trigger

Variable	My Cut	Phat's Cut
M_{jj}	> 1100	>1000
met	pfMet$>$130	metnomuon$>$200
$jet1pt$	>50	>55
$jet2pt$	>50	>55
$\Delta\eta_{jj}$	>4.2	>4.2
$\Delta\phi_{jj}$	No cut	No cut
$\eta_{j1} \cdot \eta_{j2}$	<0	<0
CJV	No cut	Cut
L1 met	No cut	>40

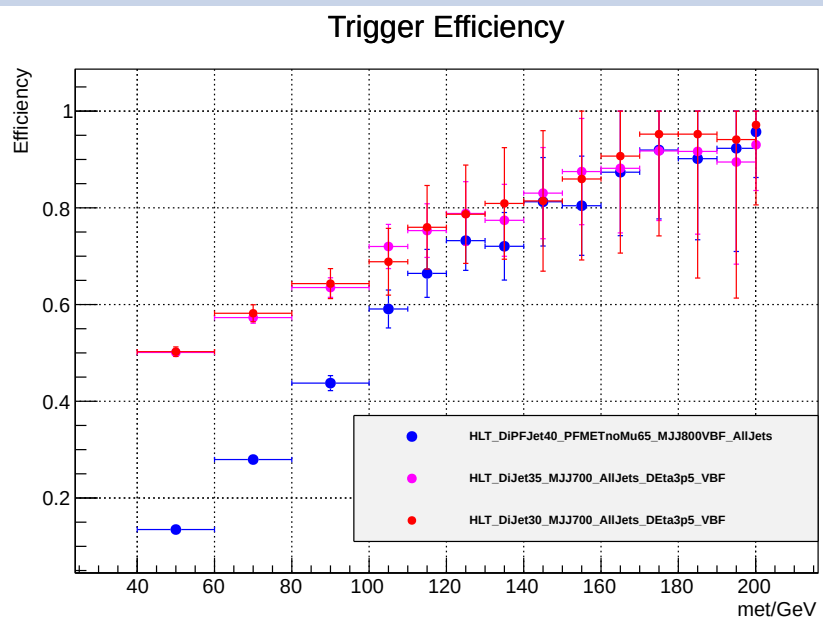
- Main differences are in L1 and Reco met cuts
- Minor differences in jet pt cuts and CJV

MET

L1 met $>$ 40 GeV

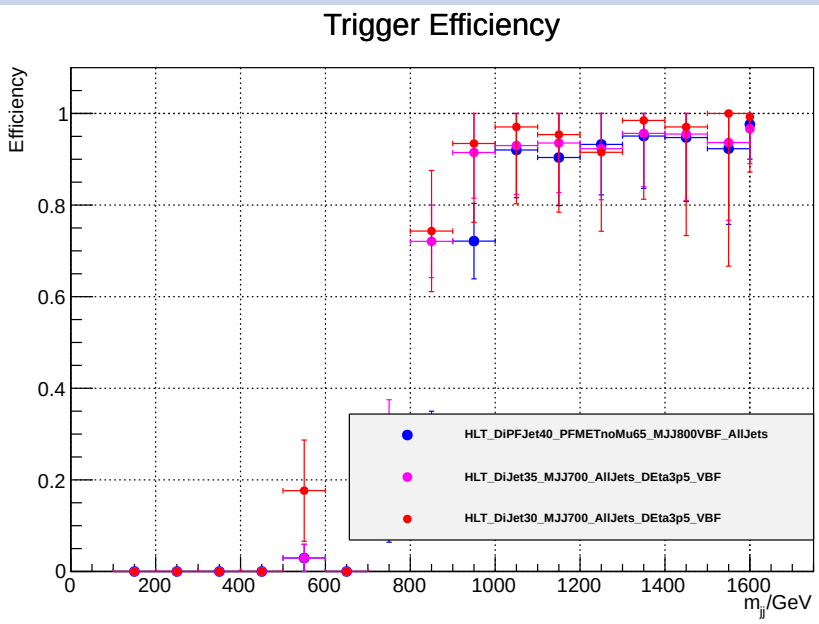


No L1 cut

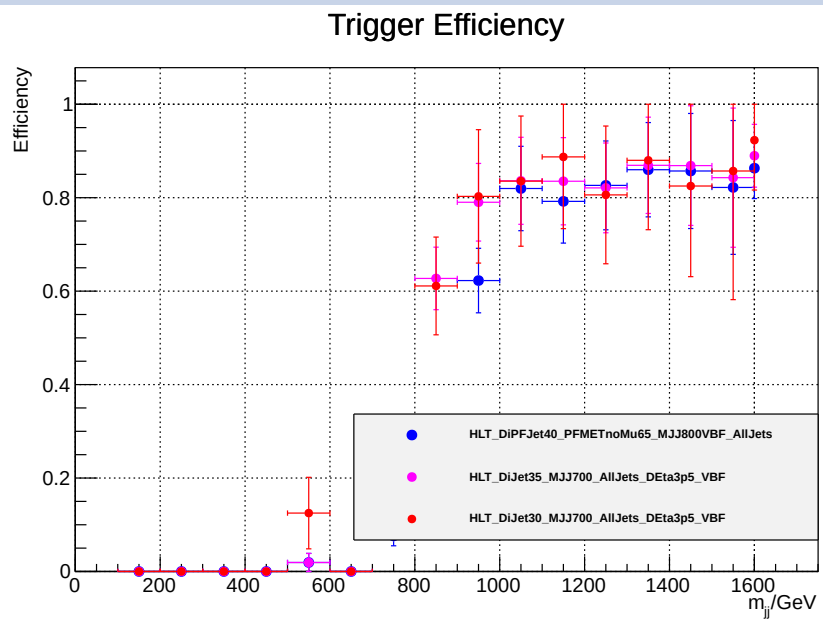


M_{jj}

L1 met $>$ 40 GeV

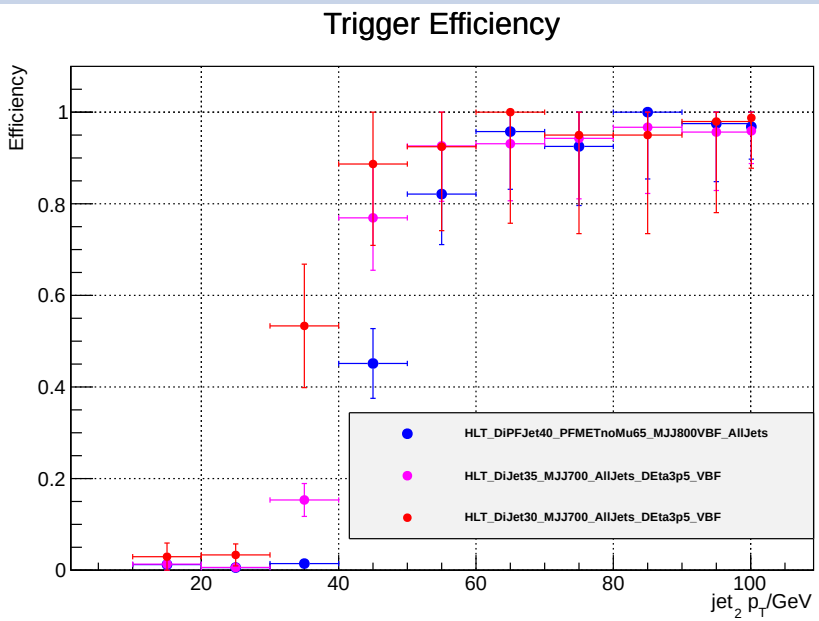


No L1 cut

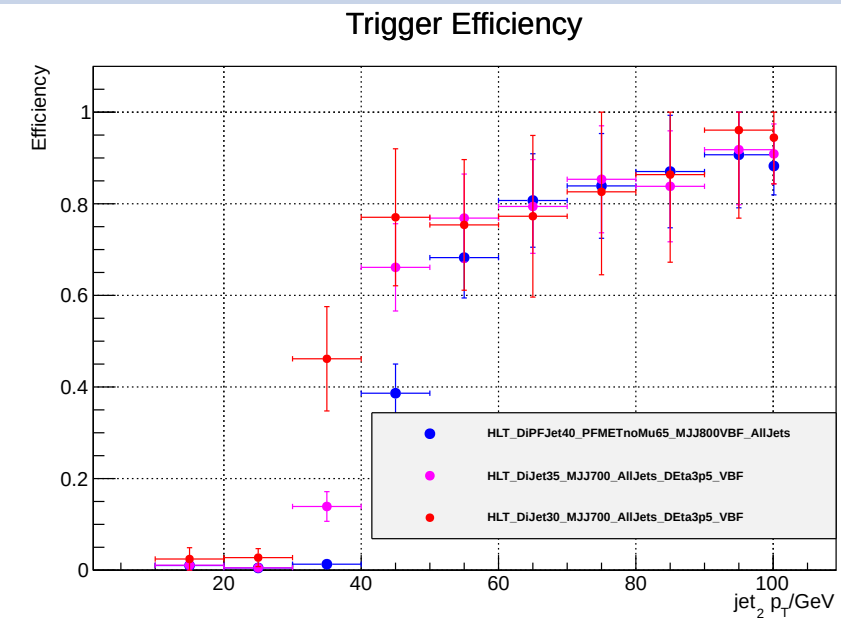


Jet 2 pt

L1 met > 40 GeV

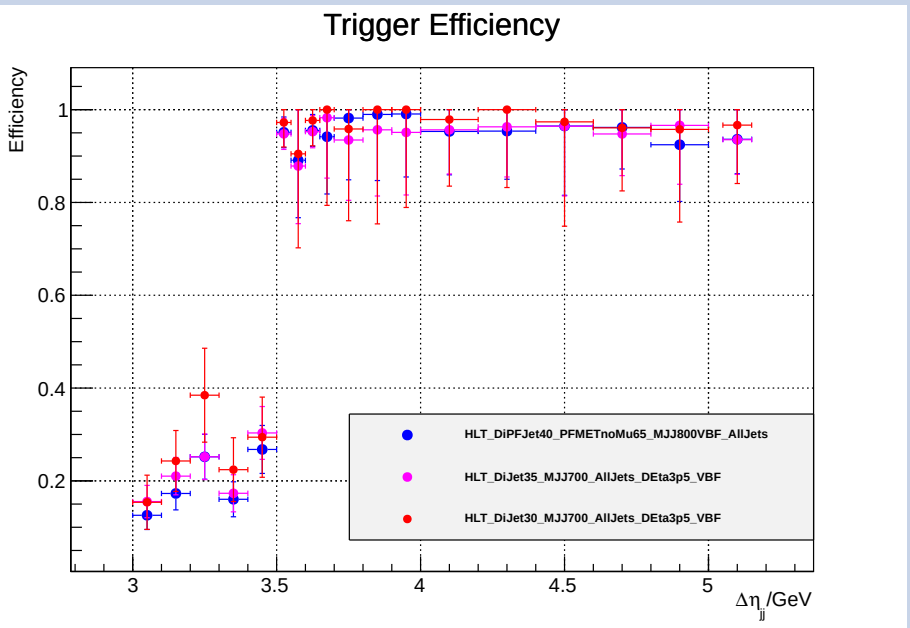


No L1 cut

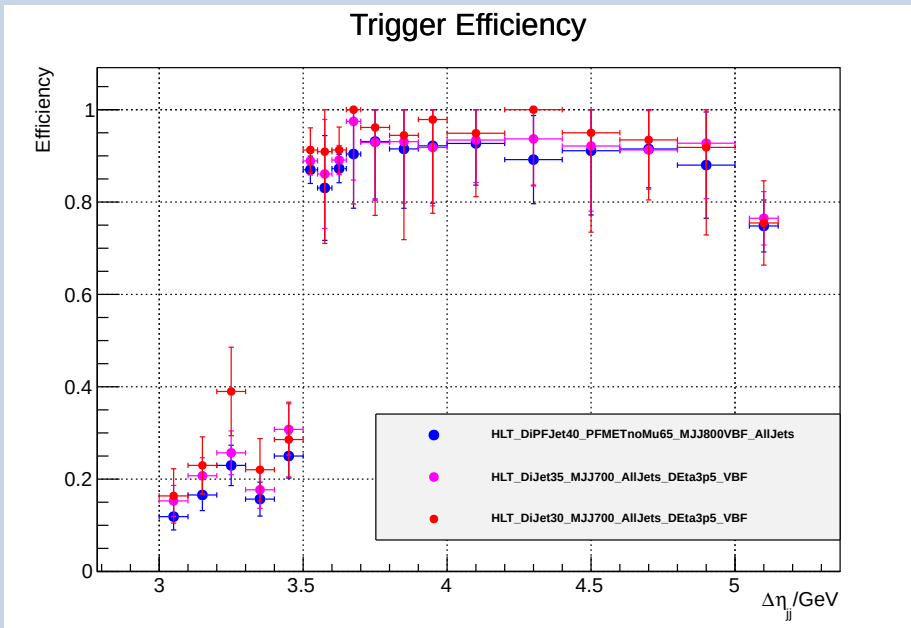


$\Delta\eta_{jj}$ - New since last week

L1 met $>$ 40 GeV



No L1 cut

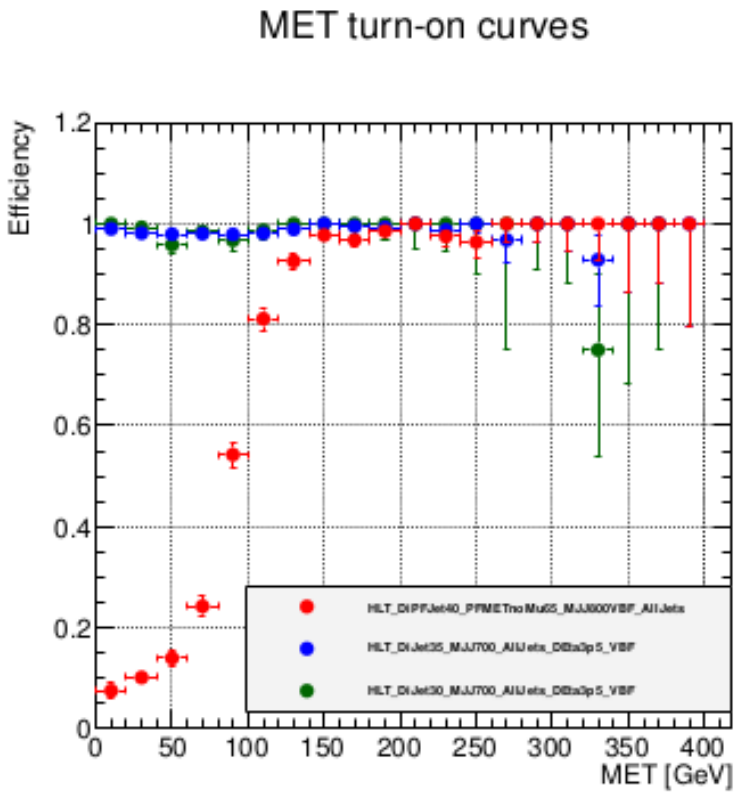


Conclusions

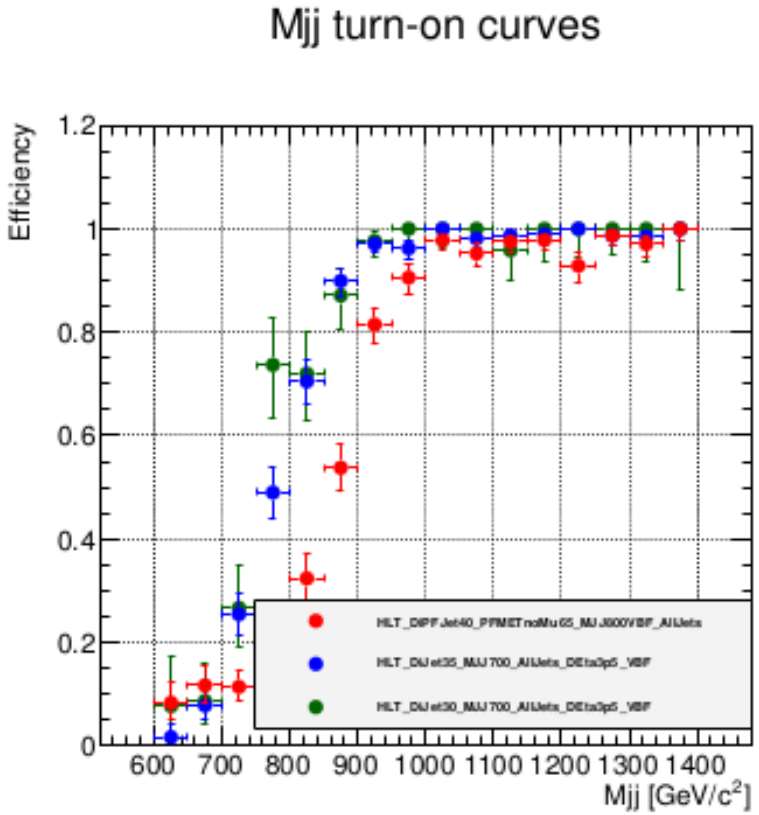
- Shape differences seen before between my and Phat's curves seem to be due to L1 met cut
- $\Delta\eta_{jj}$ turn on curve seems very sharp
  - We therefore have the option of relaxing our offline cut or increasing the trigger threshold in future
- 3D trigger efficiency work is in progress

Backup

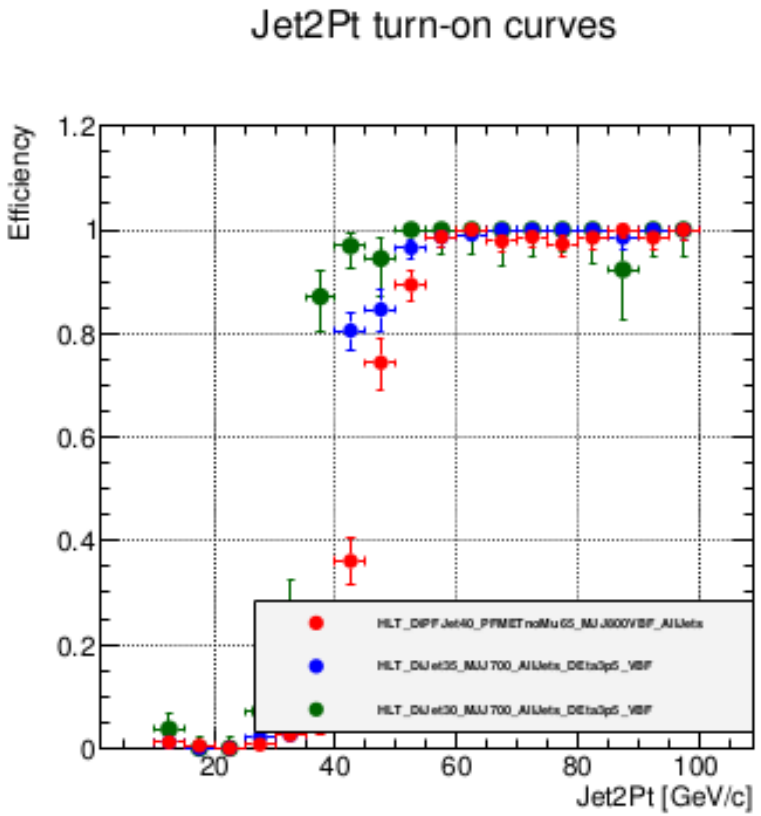
Phat's efficiencies - met



Phat's efficiencies - mjj



Phat's efficiencies - j2pt



Phat's efficiencies - l1met
