

Trigger Efficiency Measurements in Re-Reco Data

P. Dunne

Overview

- ▶ Last time I presented 1D efficiencies for met, m_{jj} and jet 2 pt
- ▶ The following changes were made:
 - Check the difference between the cuts used and those used by Phat for the paper
 - Get the $\Delta\eta_{jj}$ turn on
 - Check the effect of applying the L1 Trigger
- ▶ Preliminary results from 3D efficiency studies have been produced

Variable	My Cut	Phat's Cut
M_{jj}	> 1100	> 1000
met	pfMet >130	metnomuon >200
jet1 $_{pt}$	>50	>55
jet2 $_{pt}$	>50	>55
$\Delta\eta_{jj}$	>4.2	>4.2
$\Delta\phi_{jj}$	No cut	No cut
$\eta_{j1} \cdot \eta_{j2}$	<0	<0
CJV	No cut	Cut
L1 met	No cut	>40

- ▶ Main differences are in L1 and Reco met cuts
- ▶ Minor differences in jet pt cuts and CJV

MET

L1 met > 40 GeV

Trigger Efficiency

No L1 cut

Trigger Efficiency

$$M_{jj}$$

L1 met > 40 GeV

Trigger Efficiency

No L1 cut

Trigger Efficiency

Jet 2 pt

L1 met > 40 GeV

Trigger Efficiency

No L1 cut

Trigger Efficiency

$$\Delta\eta_{jj}$$

L1 met > 40 GeV

Trigger Efficiency

No L1 cut

Trigger Efficiency

3D Efficiencies

- ▶ Picked bins in m_{jj} , met and jet 2 pt cut
- ▶ Statistics are very limited when more than about 3 bins are used for each variable
 - jet 1 pt cut was relaxed to 30 GeV to increase stats

HLT_DiJet35, $120 < met < 160$

HLT_DiJet30, $120 < met < 160$

Conclusions

- ▶ Shape differences seen before between my and Phat's curves seem to be due to L1 met cut
- ▶ $\Delta\eta_{jj}$ turn on curve seems very sharp
 - We therefore have the option of relaxing our offline cut or increasing the trigger threshold in future
- ▶ 3D trigger efficiency work is in progress
- ▶ Code to write 1D efficiencies into format read in by analysis frameworks is being written
