

## Progress with Limits

P. Dunne

## Reminder of last week

- ▶ Most systematics now implemented:
  - Still missing: ggH theory uncertainties, WGamma cross section uncertainty, error on QCD contribution.
- ▶ Still currently ignoring QCD
- ▶ Had tried region with less QCD:
  - $m_{\text{sig}} > 4$ ,  $\min \Delta\phi(\text{alljets}, \text{metnomu}) > 1.5$
  - expected limit: 0.9102
- ▶ Added  $m_{jj} > 1000$  and CJV
  - expected limit: 0.5371

## Updates

- ▶ Top reweighting is now fully included, no noticeable change to expected limit
- ▶ Prompt selection has been applied to parked data
  - Expected limit 51%, ignoring top and QCD
  - Worse limit seems to be due to fewer data events in Z control region
- ▶ Lxplus5 shut down, need to transfer limit code to IC SL5 machines

## Scan through variables

- ▶ Have now also scanned through  $m_{jj}$ , met significance and  $\text{jetmetdphi}$  cut
- ▶ Best working point found was  $\text{metsig} > 4$ ,  $m_{jj} > 1000$ ,  $\text{jetmetdphi} > 2.5$ 
  - Expected limit: 0.2764

Process	ggH	qqH	zvv	wmu	wel	wtau	top	wg	vv	total
Rate	21.5	316.0	143.8	71.9	47.7	10.2	4.4	3.6	5.4	287

- ▶ Weights for  $V + \text{jets}$  regions decrease further needs investigating
  - $w_{\text{enu}}$ : 0.32,  $w_{\text{munu}}$ : 0.38,  $w_{\text{tau}}$ : 0 (clearly wrong),  $\text{top}$ : 0.55
- ▶ Limits ignoring systematics are 10.2%, was 16.6% for prompt
- ▶ 19 events in Z control region, was 12 for prompt

## Uncertainty Impact Check- some low impact not listed

Nuisance	% change from removal	% change from addition
CMS_eff_m:	-0.7%	3.8%
CMS_scale_j:	-2.8%	3.8%
CMS_res_j:	0.0%	0.0%
CMS_scale_met:	0.0%	0.4%
CMS_VBFHinv_puweight:	-4.3%	29.6%
CMS_VBFHinv_zvv_norm:	-2.8%	27.7%
CMS_VBFHinv_zvv_stat:	-15.6%	84.1%
CMS_VBFHinv_wmu_norm:	-0.7%	4.7%
CMS_VBFHinv_wmu_stat:	-0.7%	3.8%
CMS_VBFHinv_wel_norm:	-0.7%	4.7%
CMS_VBFHinv_wel_stat:	-1.4%	6.7%
CMS_VBFHinv_tau_eff:	0.0%	0.0%
CMS_VBFHinv_wtau_norm:	0.0%	18.1%
CMS_VBFHinv_wtau_stat:	0.0%	17.1%
CMS_VBFHinv_zvv_extrapfacunc:	-9.2%	63.1%
CMS_VBFHinv_top_norm:	0.0%	0.0%
CMS_VBFHinv_top_stat:	0.0%	0.9%

## The Wtau problem

- ▶ W tau background weight is concerning
  - Only 2 events in data control region
- ▶ Added top reweighting and NCBkg became larger than NCData
- ▶ First remove CJV from all categories
  - Limit improved by a couple of percent on removal, seems redundant
- ▶ Doesn't change number of data events in tau control region

## Loosening jet met dphi

- Next step: try loosening jetmetdphi cut in tau control region

Cut	NCDData	NSMC	Exp. Limit
>1.0	24	$118 \pm 32 \pm 24$	0.3926
>0.0	136	$118 \pm 12 \pm 10$	0.2803

- Is this extrapolation valid?
  - Check difference in mu nu shape where we have enough events
- Weight changes from 0.48 to 0.39 when cut loosened to 1.0
- Apply a 20% systematic to WTau estimate to account for this
  - Expected limit goes to 0.2998

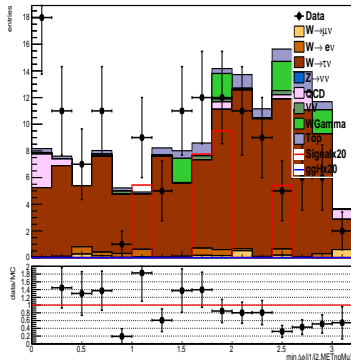

## Remaining QCD

- ▶ On checking Data-MC agreement in taunu region see data excess in low leading jet met dphi
- Put cut on leading jet met dphi

Cut	NCDData	NSMC	Exp. Limit
> 1.0	88	$87 \pm 12 \pm 9$	0.282

- ▶ Marginal change to limit
- ▶ Lower estimate seems valid due to less QCD contamination
- Weight now closer to wenu and wmuon:
- wenu: 0.32, wmuon: 0.38, wtaunu: 0.48 down from 0.65

## Conclusions

- ▶ Next steps: BDT
- ▶ More work to be done on trigger weights
- ▶ Anne Marie raised the point that our  $W+\text{jets}$  and  $W\text{Gamma}$  samples may overlap
  - Filter has been added to light tree maker, jobs running now

## Backup

## First try at limits

► Haven't fixed on QCD estimation method yet:

- Pick region where QCD small/negligible
- $\text{metsig} > 4$ ,  $\min \Delta\phi(\text{alljets}, \text{metnomu}) > 1.5$

► Rates:

Process	ggH	qqH	zvv	wmu	wel	wtau	top	wg	vv	total bkg
Rate	146	930	1065	670	467	1207	76	84	41	3610

► Expected Limit: 0.9102

- Prompt expected was 0.49

► Wtau is dominant background

## Uncertainty Impact Check - Impacts above 0.5%

Nuisance	% change from removal	% change from addition
