

## Combination of Higgs to Invisible Direct Measurements

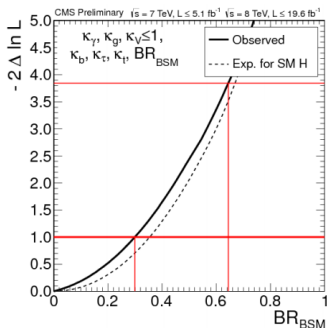

P. Dunne

on behalf of the  $H \rightarrow \text{invisible}$  analysis groups

## Introduction

- ▶ All three currently approved Higgs to invisible results have been combined
  - VBF (HIG-13-013),  $ZH \rightarrow \ell\ell + \text{inv}$  (HIG-13-018),  $ZH \rightarrow b\bar{b} + \text{inv}$  (HIG-13-028)
- ▶ Updates to combination since twiki result:
  - $ZH \rightarrow b\bar{b} + \text{inv}$  has been included
  - Correlations between uncertainties in the three channels are now properly taken into account
  - A combination of the  $ZH \rightarrow \ell\ell$  and VBF channels has been performed up to 300 GeV

## Current Indirect Result

- observed (expected) limit of 64% (67%) at 95% C.L. on  $BR_{inv}$  for a 125 GeV Higgs
- Combination between direct and indirect methods is being investigated e.g. [talk by M. Zanetti](#)

## Datacards

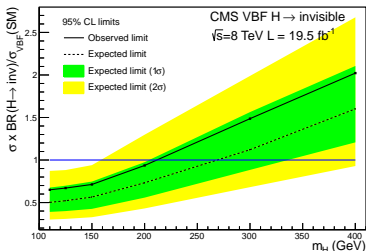

- ▶  $ZH \rightarrow ll$  analysis has datacards for 105, 115, 125, 135, 145, 175, 200 & 300 GeV
- ▶  $ZH \rightarrow bb$  analysis has datacards for 105, 115, 125, 135, 145 & 150 GeV
- ▶ VBF analysis has datacards for 110, 125, 150, 200, 300 and 400 GeV
- New VBF datacards were produced for 115, 135 and 145 GeV, with the same method as used for the twiki plot

## Combination Method

- ▶ The cards for the two approved analyses were combined using the standard Higgs combination tool
  - A bug was found in the tool that meant that  $\ln N$  correlated uncertainties were not being properly treated, fixed in latest combine version
- ▶ Correlations between analyses were taken into account according to combination group recommendations
- ▶ All other uncertainties were considered fully uncorrelated between analyses

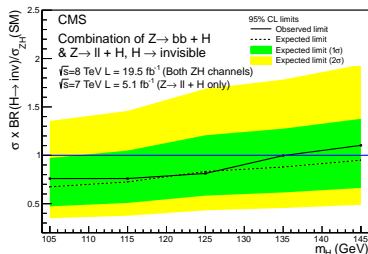

## Separate results: Direct

### ► VBF

- observed (expected) limit of 67% (52%) at 95% C.L. on  $BR_{\text{inv}}$  for a 125 GeV Higgs

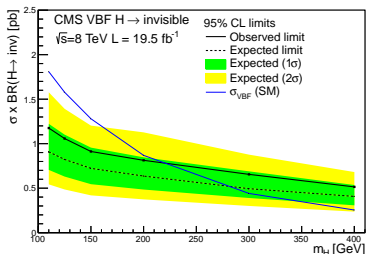

### ► ZH

- observed (expected) limit of 81% (83%) at 95% C.L. on  $BR_{\text{inv}}$  for a 125 GeV Higgs

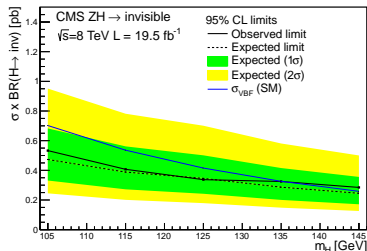

## Separate results: Cross-Section limits

### ► VBF

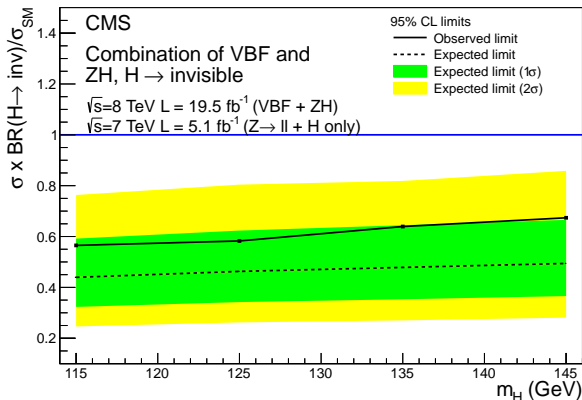

- observed (expected) limit of 67% (52%) at 95% C.L. on  $BR_{\text{inv}}$  for a 125 GeV Higgs

### ► ZH

- observed (expected) limit of 81% (83%) at 95% C.L. on  $BR_{\text{inv}}$  for a 125 GeV Higgs

## Combined Results

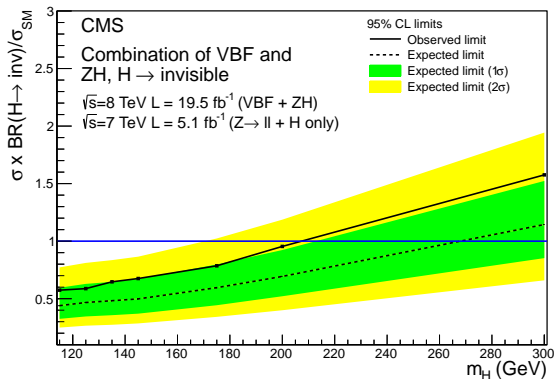

- Observed (expected) limit at 125 GeV is 58(46)%

## High mass combination

- ▶  $Z \rightarrow \ell\ell + \text{inv}$  and VBF both have datacards up to 300 GeV
- ▶ The same combination method as used above was used to combine these two channels between 115 and 300 GeV

## Conclusions

- ▶ All three Higgs to invisible channels have been combined using the standard Higgs combination tool
- ▶ The result is compatible with the SM at between the 1 &  $2\sigma$  level depending on Higgs mass
- ▶ The combined result gives strongest direct limit on the invisible branching fraction of the SM Higgs

## Backup

## Previous Limits

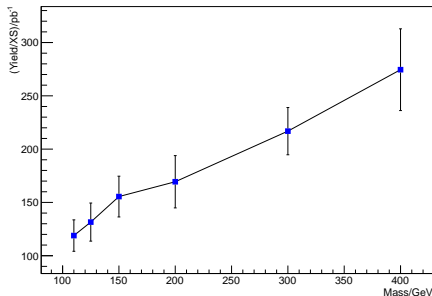

- ▶ CMS PAS limits on  $BR_{inv}$  for a 125 GeV Higgs boson are:
  - VBF: observed (expected) limit of 69% (53%) at 95% C.L.
  - $ZH \rightarrow ll + inv$ : observed (expected) limit of 75% (91%) at 95% C.L.
  - $ZH \rightarrow bb + inv$ : observed (expected) limit of 182% (199%) at 95% C.L.
  - CMS indirect limit, from visible channels: observed (expected) limit of 64% (67%) at 95% C.L.
- ▶ ATLAS also produce an indirect limit and a limit in the ZH channel:
  - Indirect limit 60% (no expected limit given)
  - ZH: observed (expected) 65% (84%)

## VBF Cross-sections

Mass/GeV	$\sigma/pb$
110	$1.809 \pm 0.048$
115	$1.729 \pm 0.046$
125	$1.578 \pm 0.042$
135	$1.448 \pm 0.038$
145	$1.333 \pm 0.035$
150	$1.280 \pm 0.033$
200	$0.869 \pm 0.023$
300	$0.441 \pm 0.011$
400	$0.254 \pm 0.007$

## Signal Yield interpolation

- ▶  $N_{Signal} = eff. \times acc. \times \mathcal{L}\sigma$
- ▶ Luminosity is constant
- ▶ Yield over cross-section is thus proportional to efficiency times acceptance
- ▶ Signal yields were produced at 115, 125(to cross-check), 135 and 145 GeV for the VBF channel
- Cross-sections from LHC-HXSWG were used

# Summary of Uncertainties

Background	Source	Uncertainty
$Z \rightarrow \nu\nu$		
	Statistics in control region	29%
	MC statistics	14%
	Theory uncertainty	20%
	Jet/MET scale/resolution	5%
$W \rightarrow \mu\nu$		
	Statistics in control region	5%
	MC statistics	10%
	Theory uncertainty	20%
	Jet/MET scale/resolution	4%
$W \rightarrow e\nu$		
	Statistics in control region	10%
	MC statistics	10%
	Theory uncertainty	20%
	Jet/MET scale/resolution	$+5\%$ $-11\%$
$W \rightarrow \tau\nu$		
	Statistics in control region	30%
	MC statistics	20%
	Theory uncertainty	20%
	Jet/MET scale/resolution	$+16\%$ $-2\%$
	Tau ID efficiency	8%
	Electron contamination	5%

QCD		
	Statistics in control region	2%
	MC stats (background)	2%
	Jet/MET scale/resolution	$+45\%$ $-75\%$
	$E_T$ shape	35%
Other backgrounds		
	Luminosity	4%
	MC statistics	10%
	Jet/MET scale/resolution	28-81%
	Cross-section uncertainty	8-20%
Signal		
	MC statistics	10%
	Jet/MET scale/resolution	11%
	PDF uncertainty	5%
	QCD Scale uncertainty	4%
