

VBF Higgs to Invisible Trigger Efficiencies

P. Dunne on behalf of the $H \rightarrow \text{invisible}$ analysis group

VBF - Higgs to Invisible in Run II

- ▶ At the end of run 1 significant BSM Higgs properties are not excluded:
 - Direct CMS observed (expected) limit 36 (30)%
 - Indirect limit from ATLAS+CMS on $BR_{BSM} \sim 35\%$
- ▶ Most sensitive VBF channel is still statistically limited
 - Need as much data in run 2 as possible

Triggers and Dataset

Triggers

- ▶ We have two triggers running for VBF Higgs to invisible:
 - Signal trigger: unprescaled HLT_DiPFJet40_DEta3p5_MJJ600_PFMETNoMu140
 - Prescaled HLT_DiPFJet40_DEta3p5_MJJ600_PFMETNoMu80
- ▶ Will show efficiencies for signal trigger today

Dataset used for efficiency measurement

- ▶ Use SingleMuon dataset to measure efficiency
 - We have 1280 pb^{-1} processed
- ▶ We are using the latest 74X_dataRun2_Prompt_v4 jet energy corections
- ▶ We are using the latest MET filter recipes
 - CSC filter is due to be replaced with an event list to veto although this is not yet available
- ▶ Cuts for efficiency denominator chosen where trigger is 90% efficient

Trigger Efficiencies

- ▶ Denominator is all events in SingleMuon passing:
 - $\text{MET}_{\text{noMu}} > 300 \text{ GeV}$, $\text{DiPFJet} > 80 \text{ GeV}$, $\Delta\eta_{jj} > 3.6$, $M_{jj} > 600$
- ▶ Cut on variable shown is not applied

Trigger Efficiencies

- Denominator is all events in SingleMuon passing:
 - $\text{MET}_{\text{noMu}} > 300 \text{ GeV}$, $\text{DiPFJet} > 80 \text{ GeV}$, $\Delta\eta_{jj} > 3.6$, $M_{jj} > 600$
- Cut on variable shown is not applied

Summary

- ▶ Trigger efficiencies from 25ns data shown
- ▶ Possible dips in efficiency above turn on in MET and jet 2 pt
 - Need investigating and monitoring as statistics increase
- ▶ MET and jet p_T turn ons are very high
- ▶ We will continue to update these plots as new luminosity and recipes become available
